

CS-03 Phishing Awareness Kit

Assessment Report

Prepared by: Ismail Victor Elias

1. Executive Summary

This project provides a safe browser-based phishing-awareness training kit. It teaches users to recognize suspicious messages, verify requests and report phishing. The MVP contains training content, a fictional phishing exercise, a five-question quiz, scoring and reporting guidance. No real credentials or malicious links are used.

2. Problem Statement

Staff may fall for phishing messages that use urgency, impersonation, suspicious links, unexpected attachments or requests for sensitive information. The kit addresses this problem through practical awareness training and measurable assessment.

3. Objectives

- Teach common phishing warning signs.
- Provide a safe recognition exercise.
- Assess understanding with an interactive quiz.
- Promote STOP → CHECK → VERIFY → REPORT behavior.
- Define metrics for measuring awareness.

4. MVP Components

Component	Purpose
Training content	Explains phishing and common red flags.
Spot the Scam	Fictional payroll-themed message for red-flag identification.
Quiz	Five questions covering key phishing behaviors.
Scoring	Calculates score and awareness percentage.
Reporting guidance	Provides a simple response process.

5. Safe Simulation Design

The demonstration uses fictional content and a non-real example domain. It does not collect passwords, OTPs, bank details or other real credentials. The purpose is recognition and reporting, not credential harvesting.

6. Metrics Plan

- Training completion rate: $\text{completed participants} \div \text{assigned participants} \times 100$.
- Average quiz score: mean score of completed quizzes.
- 80%+ rate: participants scoring at least 80%.
- Most-missed topic: identify the question/topic with the most incorrect responses.
- Reporting behavior: measure correct reporting during an authorized safe exercise.

7. Remediation / Hardening Recommendations

- Enable MFA to reduce the impact of stolen passwords.
- Strengthen email filtering and anti-phishing controls.
- Independently verify payment, password-reset and sensitive-data requests.
- Provide a clear IT/security reporting channel.

- Run recurring awareness training.
- Apply least privilege to reduce the impact of compromised accounts.
- Monitor reports and investigate repeated phishing patterns.

8. Safe-Lab Evidence

Recommended evidence: homepage screenshot; phishing exercise screenshot; revealed red flags; quiz question and feedback; final score; project files; and, if a VM is used, evidence that testing occurred only in an isolated authorized environment.

9. Limitations

The MVP is an awareness-training demonstration rather than a production phishing platform. It does not provide real email delivery, identity management or centralized enterprise analytics.

10. Conclusion

The CS-03 kit combines practical training, safe simulation, assessment and measurable awareness goals. It provides a foundation for improving staff ability to identify, verify and report phishing.

Safety: Use only for authorized defensive awareness training.
